Preface

While discussing the basics of medical science in any system of medicine Tashreehul Badan (Human Anatomy) is the most basic and fundamental subject and Sound knowledge of Tashreehul Badan is the main building material of a scholar of medical science. One of the differences between an expert and ordinary professional is the in depth understanding of basic subjects. Tashreehul Badan is one of the most fundamental of all medical sciences because of its involvement with structure of human body. Tashreehul Badan including general, regional and systemic, is primarily the scientific study of the morphology of the human body. It also provides the basic framework and vocabulary used in all descriptions and communications about the body. Tashreehul Badan can be taught regionally or systemically, that is, respectively, studying *Tashreehul Badan* by bodily regions such as the head, neck, thorax, abdomen and limbs or studying by specific systems, such as the nervous or respiratory systems. Students as well as the healthcare professionals, sportsmen or professionals collaborating with the medical field will find it impossible to make progress without the sound knowledge of Tashreehul Badan. Unani and other Professionals associated with the regimens of pain relief finds it most difficult to cure a specific pain without the knowledge of macroscopic and microscopic Tashreeh of that area. A thorough working knowledge of Tashreehul Badan is required by physicians, especially surgeons and doctors working in some diagnostic specialties, such as histopathology and radiology. Good teaching methods are the backbone for the understanding of any subject and these should be chosen very carefully according to the needs of the subject and as far as Tashreehul Badan is concerned there are lots of method of teaching and learning Tashreehul Badan in which some of the important ones are human structure models, skeletons, textbooks, diagrams, photographs, lectures and tutorials, and in addition, medical students generally also learn gross anatomy through practical experience of dissection and inspection of cadavers. Methods have also improved dramatically, advancing from examination through dissection of cadavers to technologically complex techniques developed including X-ray, ultrasound, and MRI. The study of microscopic anatomy (or histology) can be aided by practical experience examining histological preparations (or slides) under a microscope. So, in a nutshell Tashreehul Badan is a complementary basic medical science, which is taught to medical students in their first year at medical school so that their intellectual pursuits regarding medicine are enhanced.
